

Slow Release Irrigation Pouch

Product Guide

Description:

This slow release watering pouch continuously diffuses water to the root of the tree/plant for a period of about two weeks.

It refills during periods of rain but in case of drought the pouches can be easily refilled by watering manually or by immersion.

They can be used for any planting but are especially suitable for use when initially planting large shrubs and trees.

They have a life span of 3-5 years so are extremely suitable for the establishment of newly planted trees and shrubs.
